Medical Risks is a collection of mortality "abstracts" and articles, most of which have appeared in the Journal of Insurance Medicine starting in 1986. A mortality abstract is a compact way of combining a brief descriptive text with tables of observed deaths and rates, and age/sex-matched data derived from standard life tables. Comparative morbidity data are also shown, and the life table format enables rates of survival to be derived, if not already in the table.

This book's potential value is demonstrated in its endeavor to bring together in one convenient source useful comparative mortality data from follow-up articles scattered in hundreds of medical journals - a vital timesaver for the many physicians and other health scientists outside the life insurance industry. In addition to providing such a single source of mortality data, this compend also contains articles on methodology for life table construction, for evaluation of follow-up studies and preparation of abstracts for them, for classifying the material, and for using statistics in cost-benefit analysis.

Order now and receive Medical Risks at the special pre-publication price of $50.00. Orders must be prepaid and received by MIB, Inc. before August 26, 1994.

1991 Medical Risks: Compend of Mortality and Morbidity is a 329 page collection of abstracts and articles published by Praeger Publishers at the list price of $95.00.
